Claims 1-18 cancelled.

19. (New) A radio apparatus embodied in a radio telephone, comprising a display device; a first control element and a second control element for selecting and/or activating functions of the radio apparatus which are displayed on said display device, said first and second control elements being disposed neighboring said display device so that a local association exists between said first and second control elements and displaying of functions of the radio apparatus on said display device, wherein a first operating state is provided in which an information about said first operating state on said display device is associated with said first control element, and in which a function for activation of a second operating state on said display device is associated with said second control element, wherein said second operating mode is associated with said first operating mode, and wherein an information in said second operating mode is converted into a function for activation of said first operating mode, which function is activatable by said first operating element.

20. (new) A radio apparatus as defined in claim 19, wherein in said second operating mode an information about said second operating
